

Life of a UCSB Walker by Ben Wollack

Walking is an underappreciated way to get around. It gives me time to destress in a busy day, it’s healthy, and I never have to worry about my bike getting stolen. However, I wondered how much I’m actually walking and if there’s certain days I walk more. The data was collected for 31 days from 2026/04/23 - 2026/05/23.

Daily Distance Walked

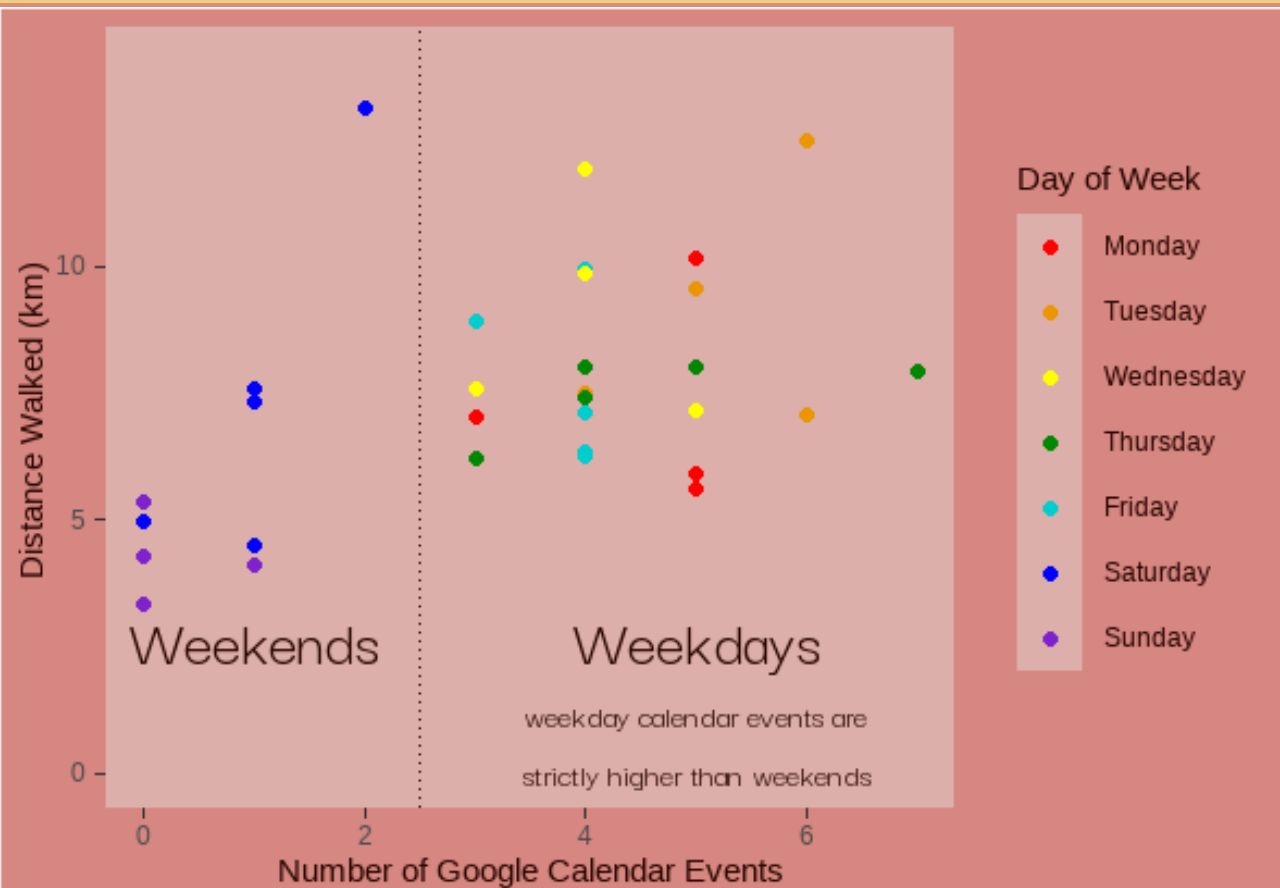

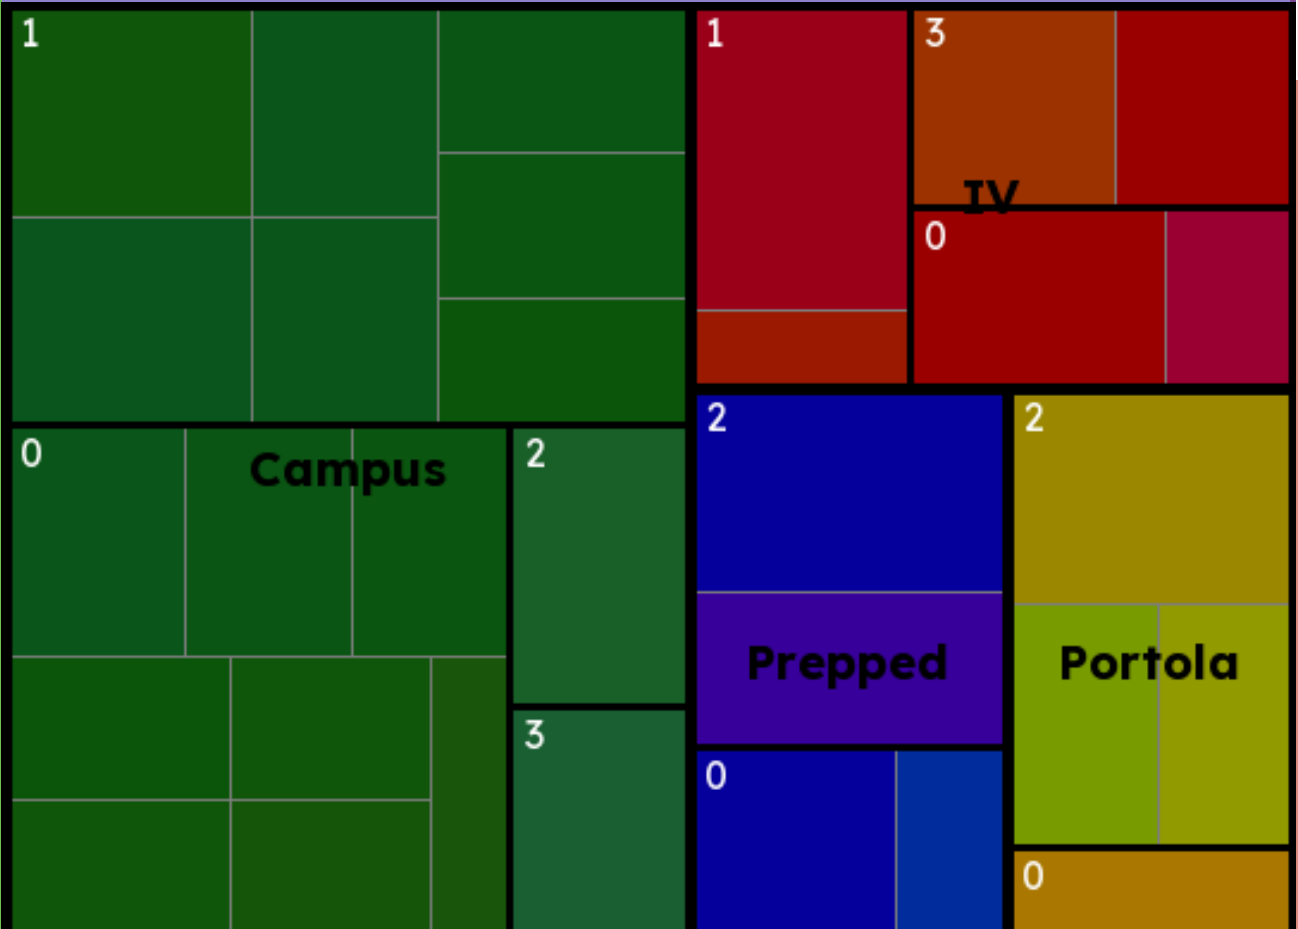

Each point represents the distance I walked in one day, with colors labeling the day of the week.

Since I was not walking to campus on weekends, the distance walked was generally lower (especially on Sundays, there were some Saturdays I went to the lib). The most walking I did in one day was a hiking day with my California Flora class near Gaviota Peak.

Distance Walked by Lunch Location and Bus Trips

Colors represent the lunch location for the day, numbers represent daily bus trips (outlined by the black borders) and box size represents distance walked.

I mainly ate on campus (thank you meal plan). Prepping was mainly done when I was going out of town (often for hikes). There is no apparent correlation between lunch location or bus trips and distance walked.

Calendar Events Varies by Day of Week and Affects Distance Walked

The distance walked is plotted with the number of calendar events per day. Colors represent the day of the week.

Weekdays always had more calendar events than weekends (unsurprisingly), which is noted in the chart. There also appears to be a slight positive correlation between calendar events and distance walked since events create an obligation to walk.
